

RSM Application Software Development Challenge

Name:

Edgar Josué Gómez Meléndez

Prompts used:

1. For the prompt used for Copilot using Gemini

I need to build a Front end using these especification:

1. Inventory Value: A KPI card showing the total sum of ListPrice across all products.
2. Distribution by Color: A pie/doughnut chart (you can use Chart.js or ApexCharts) showing the product count per color.
3. Customer Analysis: A bar chart showing the number of people grouped by PersonType.
4. Stock Management: A table that filters or highlights products with low SafetyStockLevel.

We use the AdventuresWorks 2022 db for the proyect, I have the folder where the API is running to take the endpoints, so made a detailed prompt to pass it to Copilot and Implement this view using Vue 3, Vite, Vue Router and Axios, leave the space to let me add the folders and names of the documents to work with.

The API is made with C#, if you see convenient to ask for more information let me know

2. Prompt generated for Github Copilot to create a plan to implement the dashboard

Context:

I am building a Dashboard for a Sales/Inventory system using Vue 3 (Composition API), Vite, Vue Router, and Axios. The backend is a C# API connected to the AdventureWorks 2022 database.

Task:

Generate a plan to implement this dashboard view called InventoryDashboard.vue inside #file:frontend src/views. Please include the following components and logic:

State Management: Use Axios to fetch data from the following (placeholder) endpoints:

GET /api/products: Should return a list of products including ListPrice, Color, and SafetyStockLevel.

GET /api/persons: Should return a list of people including the PersonType field.

Requirements:

KPI Card (Inventory Value): Calculate the total sum of ListPrice from all products and display it in a styled card.

Distribution by Color (Pie/Doughnut Chart): Use [Chart.js / ApexCharts] to show the count of products per color. Map the data from the products array.

Customer Analysis (Bar Chart): Show the number of people grouped by PersonType (e.g., SC, IN, SP, EM).

Stock Management (Table): Create a table listing products. Add a search filter and highlight rows where SafetyStockLevel is below a threshold (e.g., 500).

Styling: Use Tailwind CSS (if available) or standard CSS for a modern, clean look.

Project Structure: Assume the following file structure:

src/api/axiosConfig.js: Where the base Axios instance is defined.

If you need more information let me know.

3. The implementation
